Light and Versatile

LVGL is the most popular free and open-source embedded graphics library to create beautiful UIs for any MCU, MPU and display type.

From consumer electronics to industrial automation, any application can leverage LVGL's 30+ built-in widgets, 100+ style properties, web-inspired layouts, and typography system supporting many languages.

Any device, any OS, any display

LVGL is fully open-source and has no external dependencies which makes its porting incredibly simple. It works with any modern MCU or MPU and can be

used with any (RT)OS or bare metal setup to drive ePaper, monochrome, OLED, or TFT displays, and even monitors. Besides, it's free even for commercial projects.

Ready-to-use projects maintained by us

LVGL works with any hardware from 100 MHz MCUs to multi-core Linux-based MPUs. Leading chip vendors already support LVGL in their ecosystem. We also provide ready-to-use projects that offer seamless integration. These projects include up-to-date repositories, responsive support, and extensive documentation.
